Data Manipulation Language

1. DML → Data Manipulation Language
2. This Language is used to manipulate the data only not the schema/columns/table
3. only adding/updating/deleting the data of the table

1. Insert

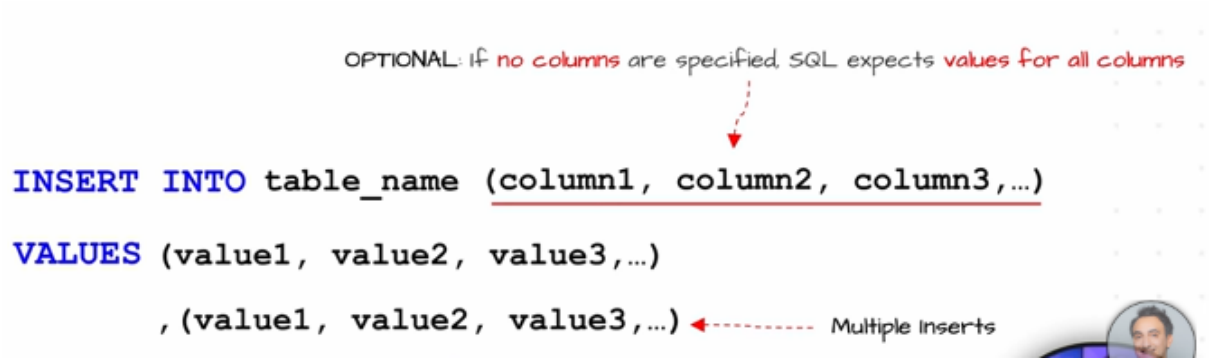

1. Inserting is used to insert the data to the table
2. Two Ways to add the data(means adding data in the row only not in column)

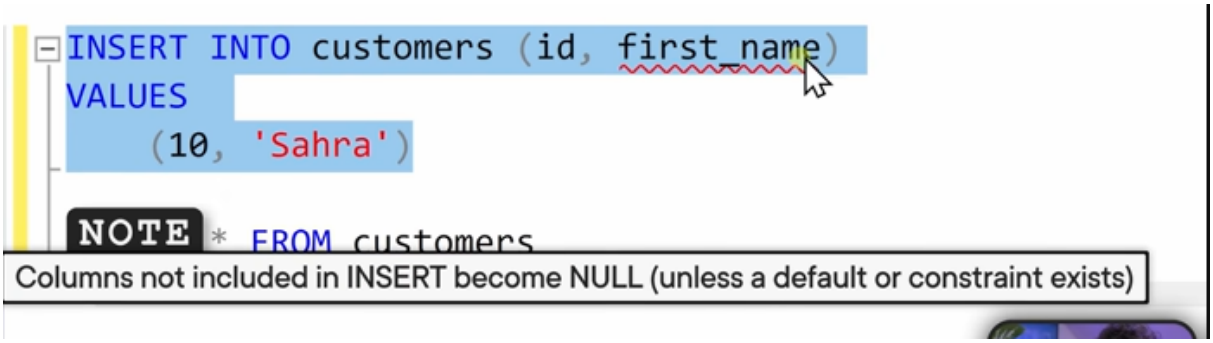

```
INSERT INTO table_name (column1, column2, column3,…)
VALUES (value1, value2, value3,…)
```

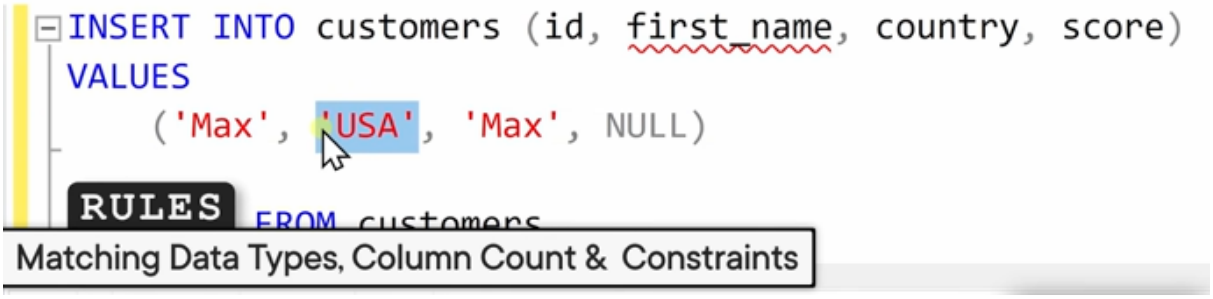

1. Just giving the INSERT INTO table_name → no columns name ⇒ then we need to give the values completely and make sure those should match the field data-type
   a. if three columns are there then in values
      i. Values(1,”hemanth”,”india”) → 1st column of the table shpuld be int,2nd 3rd col must be string .. else error
2. Giving the Column names by passing along with table_name .
   a. Make Sure the no.of Values we are giving must match with the columns we are giving along with the data-type

**** The remaining columns will automatically becomes null → make sure when adding the values you must give the column value that is in not-null condition in table schema.

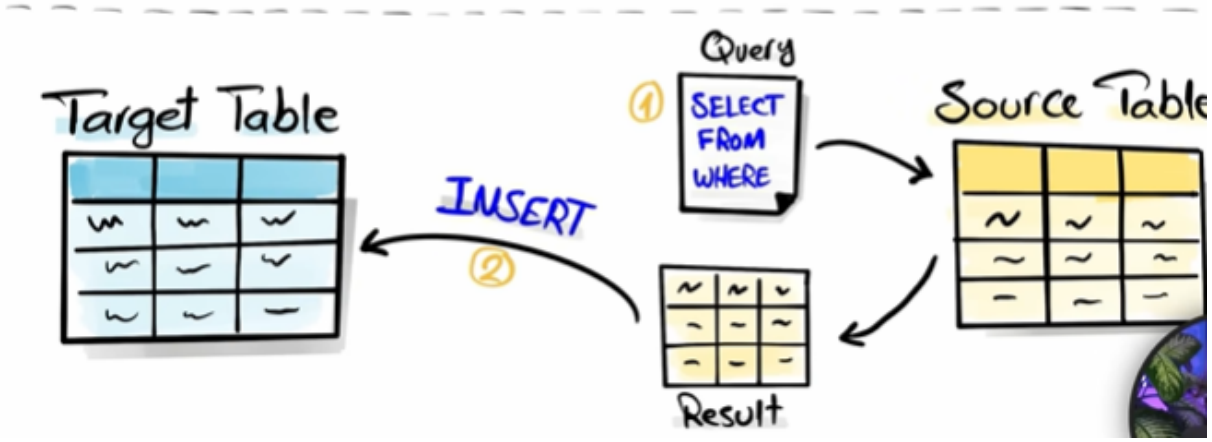

**** Constraints should match ⇒ not-null,unique etc..

2. Inserting Table

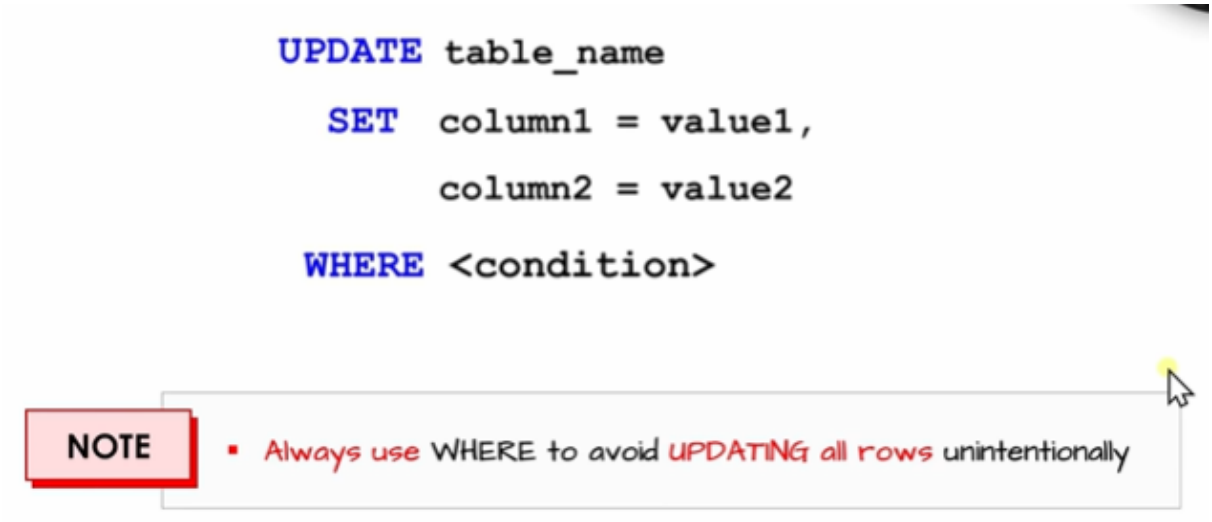

```sql
-- Insert data from 'customers' into 'persons'
INSERT INTO persons (id, person_name, birth_date, phone
SELECT
id,
first_name,
NULL,
'Unknown'
FROM customers
```

Results Messages

	id	person_name	birth_date	phone
1	1	Maria	NULL	Unknown
2	2	John	NULL	Unknown
3	3	Georg	NULL	Unknown
4	4	Martin	NULL	Unknown
5	5	Peter	NULL	Unknown
6	6	Anna	NULL	Unknown
7	7	Sam	NULL	Unknown
8	8	USA	NULL	Unknown
9	9	Andreas	NULL	Unknown

3. Update

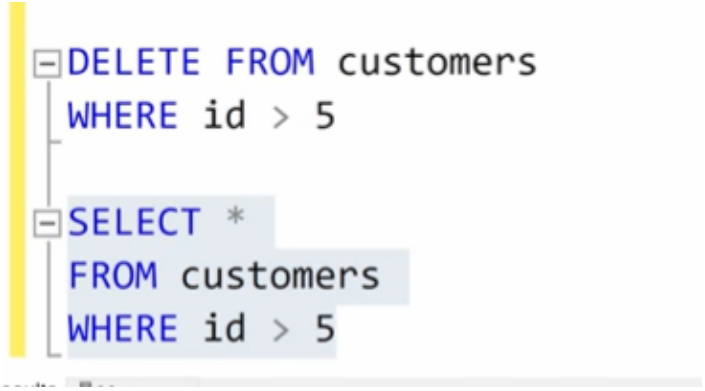

1. it is used to modify your data of the table , not modifying the table
2. Alter → for modifying the table, update → for data

3. If Where is not used then all the data of that column will modify . else only that selected rows will modify their respective data

4. Delete, Truncate

1. Delete the data not the table/schema/colums like Drop do

2. Delete is Slow , so Truncate is helpful which do the same operations but faster than Delete
3. To Delete all data from tables(not schema) then Truncate Table Persons
